# SwarmOnline Github Search Application

Firstly, the packages necessary for the application should be installed

```
npm install
```

To run the development version of the application run the following command

```
npm run dev
```

To run the unit tests for the application run the following command

```
npm run test
```

Pending Issues:

- Small dash ( - ) character appears on RepositoryResults - Unknown gremlin

- If pages are changed too fast ( < 1.5 seconds between clicks) then some results can 'stick around'

- There is a warning when running the tests about an unknown custom element, I could not stub it successfully. All the tests still pass however.

Things I want to implement in further iterations:

- More unit tests

- Text highlight in results for pieces that match search term

- More responsive CSS breakpoints

Things to note:
- Github only lets you access the first 1000 results, so the application is therefore limited to 34 pages maximum
